

Sam Kessler

CISC 1600

The website I am submitting for project 1 is a fork of my original website that I made early this summer. The website has been adjusted to fit mostly with the project's requirements while keeping my own twist. The project wanted to have the links for multiple pages centered and at the bottom. I disagree with that as it may not be super visible to every user on every screen. Therefore, I stuck with my original design with a navigation bar in a fixed position located at the top of the screen. My favorite change I made to the new site is having the content of the website have both a uniform class name and a unique id. This allowed me to position the content under the navigation bar properly while still allowing me to customize each page CSS properties in the style.css file.

Another significant change from the original project requirements is keeping the introduction paragraph on my front page and substituting the separate about page with a page dedicated to describing the work I have accomplished over my short career. My reasoning for sticking with this design choice is based on advice from the CUNY 2X career advisor on resume design. According to him and other advisors on resume design, you want the intro to front and center, so the reader doesn't immediately get bored and discard your resume. My page is designed to be a more detailed resume to bypass the resume length requirement of being only one page long.
